

RELATED VS. RELATEDTABLE IN POWER BI

DAX Formula: RELATED()

- Fetches a value from a related *lookup* table.
- Works when there's a *many-to-one* relationship.
- Example:
- `ProductCategory = RELATED(Product[Category])`

DAX Formula: RELATEDTABLE()

- Returns a table of rows from a *related* table.
- Works with *one-to-many* relationships.
- Example:
- SalesCount = COUNTROWS(RELATEDTABLE(Sales))

Use Case Example: RELATED()

- Scenario:
- You want to display Product Category in the Sales table.
- Tables:
 - - Sales Table: ProductID, Quantity, TotalAmount
 - - Product Table: ProductID, ProductName, Category
- DAX:
 - Category = RELATED(Product[Category])

Use Case Example: RELATEDTABLE()

- Scenario:
- You want to count how many sales transactions exist for each Product.
- DAX:
- SalesCount = COUNTROWS(RELATEDTABLE(Sales))

RELATED vs RELATEDTABLE: Key Differences

Feature	RELATED	RELATEDTABLE
Returns	Single Value	Table
Relationship	Many-to-One	One-to-Many
Use Case	Lookup values	Aggregate related rows
